Brainstorming & Idea Prioritization

Phase 1 | Product discovery and feature selection

Purpose and framing

This deliverable records the product idea and a practical priority order for a travel-planning capstone. It is based on the application inputs and workflows present in the repository, not on a formal interview study.

Opportunity areas

- Help a traveler turn destination, dates, budget, group size, style, pace, interests, and dietary needs into one structured plan.
- Keep the plan useful after generation through accounts, saved trips, trip editing, and day regeneration.
- Offer a local itinerary-generation path when a remote model is unavailable.
- Make a plan portable through copy, browser share, and Markdown download.
- Keep boundaries clear: the app does not book travel or verify live availability, prices, or opening hours.

Prioritization

Priority	Idea	Reason
Must	Generate a structured day-by-day itinerary	The core outcome of the planner.
Must	Authentication and user-scoped trip library	Supports saving and managing plans.
Should	Edit a trip and regenerate a day	Enables iteration after the initial plan.
Should	Copy, share, and download summaries	Makes saved plans easier to carry or discuss.
Could	Live maps, weather, booking, collaboration	Useful later, but not in the current implementation.

Concept selected

Build a web app where a signed-in traveler enters trip preferences, reviews a generated itinerary, saves it, and returns to edit or export it. The React/Vite frontend and FastAPI backend already implement this central flow.

User types and pain points in this report are product hypotheses inferred from the implemented feature set. Validate them with actual travelers before treating them as research findings.

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
