Define Problem Statements

Phase 1 | User need and product opportunity

Primary problem statement

Travelers planning a multi-day trip may need to gather preferences and organize activities across scattered sources. They need a useful first itinerary that reflects their dates, budget, interests, pace, and group context, and that they can revise as plans change.

Supporting problem statements

- A generated itinerary that cannot be saved may have little value after the current session.
- A traveler may want to alter one day without replacing the entire plan.
- An app that depends on one remote AI service may be unavailable when that service is unreachable or unconfigured.
- A share link can be misunderstood if access requirements are not explained.

Who experiences the problem?

Audience hypothesis	Need	Evidence in this project
Independent traveler	A fast starting plan tailored to personal preferences.	Trip builder collects preferences and calls the itinerary API.
Small travel group	A plan that records group size and shared interests.	Request schema includes traveler count and interests.
Returning traveler	A place to revisit and adjust a saved plan.	Account, saved-trip list, detail, update, and delete flows exist.

How might we?

- How might we turn a small set of travel preferences into a readable itinerary draft?
- How might we let users refine a day without losing the rest of their saved trip?
- How might we preserve a useful planning path when model services are unavailable?

Validation needed

Run interviews or usability sessions with target travelers. Ask how they plan today, which constraints matter most, what they trust in generated suggestions, and how they would share or revise a plan. No interview data is included in this deliverable.

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
