Customer Journey Map

Phase 2 | End-to-end planning experience

Journey overview

Stage	User action	System touchpoint	Potential friction
Arrive	Open planner and understand its purpose.	Home/account route.	New visitors must sign in or register before planning.
Account	Register or log in.	/auth routes and token storage.	Credential errors or network failure.
Configure	Enter destination, dates, budget, style, pace, interests, group size, dietary needs.	Trip form and Pydantic request schema.	Missing or invalid fields; dates are strings.
Generate	Request and review days and activities.	/trips/plan; AI provider or local fallback.	Remote latency or generic suggestions.
Save	Save plan and open My Trips.	/trips/create and trip services.	Persistence depends on Supabase configuration.
Refine/export	Edit details, regenerate a day, copy/share or download.	Trip detail and saved-trip APIs.	Share routes still require authentication.

Moments that matter

- Make required trip inputs understandable before generation.
- Give feedback while an itinerary is loading or generation fails.
- Preserve the user's current itinerary when saving rather than unexpectedly replacing it.
- Confirm that a regenerated day is saved and that other days remain intact.
- Explain that a copied URL is an authenticated route, not anonymous public sharing.

Measures to consider

Potential product measures include trip-generation completion rate, save rate, successful day-regeneration rate, and return visits to saved trips. The current repository does not provide validated analytics or baseline values for these measures.

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
