Problem-Solution Fit

Phase 3 | Product value and validation plan

Problem

A traveler may spend time collecting trip preferences and arranging activities into an itinerary that is easy to revisit and adjust.

Proposed value

The planner combines preference collection, structured itinerary generation, account-linked saving, day-level refinement, and portable summary export in one web workflow.

Fit mapping

User need hypothesis	Product response	Current evidence
Get a tailored first draft	Trip preference form and generation endpoint	TripPlanRequest and AI orchestrator.
Keep a plan after leaving	Account and saved trip library	Auth, trip services, My Trips.
Adjust one day	Feedback-based day regeneration	Regenerate endpoint and TripView flow.
Take plan elsewhere	Copy/share and Markdown download	TripView actions.

Validation plan

- Ask target travelers to complete a realistic planning task without coaching.
- Observe whether inputs are clear and whether generated plans feel actionable.
- Ask how users assess estimated costs and destination-specific suggestions.
- Measure whether users save, revise, or export the itinerary.
- Use findings to reprioritize the backlog; do not infer market fit from implementation alone.

Fit status

This is a solution-fit hypothesis based on implemented capabilities. There is no customer interview, adoption, retention, or satisfaction evidence in the local project files reviewed.

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
