Proposed Solution

Phase 3 | Product behavior and scope

Solution summary

A responsive web application lets an authenticated traveler configure a trip, generate a structured itinerary, save it to an account, manage it later, and export a readable summary.

User-facing capabilities

- Account registration and login.
- Trip builder with destination, dates, style, pace, budget, currency, traveler count, interests, and dietary needs.
- Day and activity itinerary display.
- Saved trip list with detail view, editing, deletion, and selected-day regeneration.
- Copy link, copy summary, browser share, and Markdown download.

System behavior

When	System behavior
Remote AI configured	Send a structured prompt to the selected provider and parse JSON into response models.
Remote AI unavailable or malformed	Use local curated/procedural itinerary generation for planning.
Supabase configured	Use backend service-role client for durable user and trip persistence.
Supabase absent in development	Use process-local in-memory stores; data resets after restart.
Frontend network issue	Use saved-trip cache for selected local display/update paths where implemented.

Boundaries

The solution does not provide reservations, verified live travel information, public anonymous trip sharing, or a full account recovery workflow. A share URL points to a trip route whose API operations remain authenticated.

Expected outcome

Reduce the effort of creating and revising a first itinerary draft. This expected benefit should be validated with users rather than reported as a measured outcome.

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
