Performance Testing

Phase 6 | Measurement plan and scenario record

Status

No benchmark results are claimed in this report. The repository contains backend reliability/security scenario checks, but performance measurements need to be collected in a controlled run before reporting latency or capacity.

Recommended scenarios

Scenario	Measure	Suggested evidence
Health endpoint	Response latency and availability.	Repeated request samples with environment and timestamp.
Local itinerary generation	Duration by itinerary length and input complexity.	Latency distribution for 1, 3, 7, and 14 days.
Remote provider generation	End-to-end latency, timeout rate, fallback rate.	Provider/model, network, sample count, percentile latency.
Trip list/detail	API response time as account trip count grows.	Dataset size, request mix, p50/p95 and error rate.
Concurrent requests	Throughput, error rate, CPU/memory.	Load profile, worker count, container limits.
Frontend production build	Build duration and output size.	Node version, command, build summary, artifact size.

Test controls

- Use a non-production database and non-sensitive accounts.
- Record machine/container size, Python/Node versions, provider, region, and network conditions.
- Separate local fallback measurements from remote model latency.
- Warm up services consistently and report sample count and percentiles.
- Avoid inferring production capacity from a single developer-machine run.

Potential acceptance targets

Set measurable targets with the project owner before testing. Example target categories include health endpoint availability, maximum acceptable planning wait, acceptable fallback rate, and error budget under a stated concurrency level. Numeric targets are intentionally left open rather than invented here.

Result template

Run date	Environment	Scenario	Samples	p50/p95	Errors	Notes
To be recorded	To be recorded	To be recorded	-	-	-	No result entered

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
