Communication

Phase 8 | Presentation and stakeholder messaging

One-minute explanation

The Personalized Travel Itinerary Planner helps a traveler create a day-by-day trip draft from destination, dates, budget, travel style, pace, interests, group size, and dietary needs. Users can save trips, revisit or edit them, regenerate a day with feedback, and export a Markdown summary. The React frontend calls a FastAPI backend, which can use Groq or Ollama and includes a local generation fallback. Supabase stores data when configured.

Audience-specific emphasis

Audience	Emphasis
Traveler	Preference-led starting plan and editable saved trips.
Technical reviewer	Frontend/backend separation, Pydantic contracts, auth ownership, provider fallback, and persistence modes.
Project evaluator	Traceable requirements, implementation evidence, test plan, and honest limitations.
Deployment operator	Secrets, CORS origin, Supabase schema, API base URL, health check, and hosting config.

Communication principles

- Distinguish implemented behavior from proposed future work.
- Call estimated costs and generated activities suggestions, not verified facts.
- Explain that share links require authentication.
- Do not claim performance or user satisfaction results without measurements.
- Protect credentials and personal account information in demos and screenshots.

Questions to prepare for

- What happens if the AI provider is unavailable?
- Where are account and trip records stored?
- Can another person open a copied trip link?
- Are activity costs live prices?
- What would be required to add maps, collaboration, or booking?

Prepared from the current project source and configuration. Product assumptions and proposed work are labeled; no user research, test result, or deployment result is implied unless explicitly stated.
